One–sidedsplit.
One sided splits can close. Two sided splits neverdo that.
Opinions rightabovea split become the new extreme left opinions of a remaining ε-sub-profile that continues to converge. The sub–profile is at least for while not influenced by more left opinions.
The split off ε-sub–profile rightbelowthe one-sided split converges and moves upwards. It is still under the influence of opinions above the one sided split.
$x_{i+1}(t) - x_i(t) \leq \varepsilon_r$
$x_{i+1}(t) - x_i(t) \leq \varepsilon_l$
